Concrete Grinding Products

The goal of Industrial Tools, Inc is to standardize the grinding process for hard, medium, and soft concrete. We are evaluating several variables in concrete, including the variation of aggregates in different parts of the country. Our research and development team is creating the "perfect" combination of metal bond matrix and diamond size and concentration to keep the guesswork out of the concrete grinding process.

ITI is currently developing diamond segments for grinding concrete. The surface preparation industry is witnessing growth in popularity due to several advantages that grinding and polishing concrete provides in aesthetics to commercial and residential buildings. In addition to the attractive look of concrete, there are environmental and health benefits to take into consideration.

If you are a concrete contractor or surface preparation specialist who is interested in participating in our development by testing out our diamond segments, please contact us using the information below.
